Спиралевидный конический самонарезающий имплантат с конусным соединением и внутренним шестигранником, поверхность которого обеспечивает уплотнение костной ткани и повышает стабильность.

Геометрический дизайн включает двойную компрессионную резьбу, также на шейке есть микрокольца. Благодаря специальной форме имплантатов ASPER CONUS возможно одномоментное удаление зуба и протезирование для кости разного типа.

Специальное покрытие имплантатов, S.L.A. - sand-blasted, 20-40 мкм (макро) (поверхность после крупнозернистой обработки, протравлена кислотой).
